

Push Right/Angle Hand Control (right side) with AutoLock

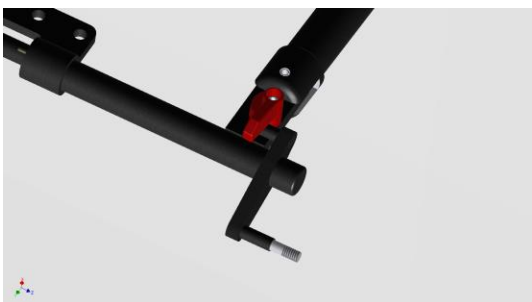

Unlike other Push/Right Angle controls, the Sure Grip Push/Right, right-hand side, does not pivot or move when the accelerator is applied. The pivot point for the Sure Grip control is on the right hand side of the wheel, and only the handle pivots. A stationary main body has many benefits for the driver including:

- Stationary brake rod
- No “in your lap” issues
- Extremely short throw
- Same easy installation you’ve come to appreciate from Sure Grip
- Meets all requirements for generic Right-Angle recommendation

Comes standard with manual Autolock

AutoLock, is an accelerator lock out device that comes standard on all of Sure Grip’s hand controls, and is an added safety feature for the driver or those that

share the vehicle. With the push of a button or knob, the accelerator function of the hand control can be disabled and help prevent accidents through misuse of the control by mechanics, valets or any other unqualified user. AutoLock is available in both electronic and manual formats.
