

Push/Pull Hand Control (right side) with **AutoLock**

The Sure Grip Push Pull right side hand control uses the same movement to apply the gas and brake as other Push/Pull controls; however the pivot point for the Sure Grip control is on the right-hand side of the wheel close to the handle, this allows for a shorter stroke and greater leverage. In addition to the pivot point, the handles position is at a slight angle, an angle that makes a big difference to the driver.

The benefits of Sure Grip's unique Push/Pull right side hand control design include:

- Less strain on the fingers
- Flexible hand positions for lower fatigue and cramping while driving
- Ability for both hands to keep contact with the steering wheel

In addition to the benefits enjoyed as a result of the handle and its position, drivers will also appreciate the other features that Sure Grip's Push/Pull right side offers including:

- Superior pedal feel, with constant acceleration and no "dead spots"
- Limited modifications to the vehicles dash
- Easier braking

AutoLock , is an accelerator lock out device that comes standard on all of Sure Grip's hand controls, and is an added safety feature for the driver or those that share the vehicle. By sliding the locking lever to the left, the accelerator function of the hand control can be disabled and help prevent accidents through misuse of the control by mechanics, valets or AutoLock is available in both electronic and manual formats.
